

SHOPIFY CONNECTOR UPDATE

To keep up with the new Shopify API updates, we have made some changes to our existing Shopify connector and revamped the fulfillment flow in particular to provide our clients with a hassle-free experience.

One notable change in the recent API updates by Shopify is the removal of the fulfillment feature from its order API endpoint. Instead, it has been moved to the fulfillmentorder endpoint. This strategic shift allows for independent management of shipments and extends support for multiple inventory locations. The upgrade supports the oldest supported stable version, ie, 2022-07, with support for future stable versions as well. Embracing this update, we have updated our connector to seamlessly integrate with the new API endpoint, offering our clients improved functionality and enhanced capabilities. By embracing these API changes, we strive to empower our clients with a more streamlined fulfillment experience, enabling them to efficiently manage their shipments and leverage the benefits of multiple inventory locations. This change essentially means:

01

When an order is placed on shopify, fulfillmentorder(s) are created for the order depending on the number of items and their location configuration.

02

An order can contain items that are being shipped from different locations.

03

These items can be fulfilled separately for each location.

04

The Shopify connector supports this new change and will enable you to sync item fulfillments from Netsuite to Shopify using this API, enabling you to fulfill different items from different locations as per the Shopify order.

The changes made to the Shopify Connector in accordance with the API changes align with the customer centric policy of Folio3, ensuring the clients have the latest and most upgraded features at hand when they use our Shopify Connector.
